

Two more fixes, and a move

After the first three fixes shipped, the same user's Regular weight failed Font Book, and checking that the fixes had landed showed CI had never once finished.

06 PostScript	Recursive-SansLine...	"" empty	Recursive-SansLine...
16 Typo Family	Recursive	deleted	Recursive
17 Typo Subfamily	Sans Linear Light	deleted	Sans Linear Light
OS/2 fsSelection	0000000011000000	0000000000000000	0000000011000000
head macStyle	0000000000000000	0000000000000000	0000000000000000

Measured by driving both builds in a browser: slice the bundled font with every axis pinned and nothing else touched, then read the saved file.

THE USER'S CONDENSED REGULAR: FOUR NAMES TYPED, SUBFAMILY LEFT AS THE FONT'S "REGULAR", SLICED ONCE

Subfamily editor "Regular" → saved "", now "Regular"
Style bits font REGULAR · USE_TYPO_METRICS → saved none, now REGULAR · USE_TYPO_METRICS

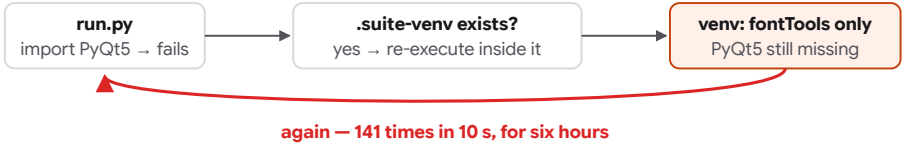

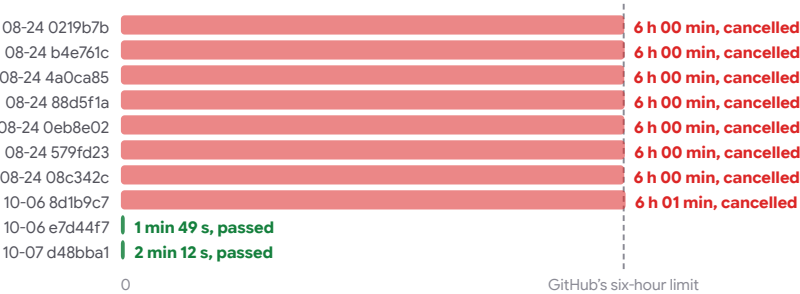

Font Book, on the user's condensed Regular: 'name' table structure — every other weight passed.

Cause. To keep links short the page records only what you changed, and since 24 August it gave the slice job only that too. The job writes names 1–6 from what it gets and deletes the rest. The CLI and the corpus fill the job from the font, so neither saw it.

Fix. The job gets the whole editor; the browser test reads every name and bit back from the saved file. Reopening the app's own link, a second path to the blank, is fixed too.

7 → 0
names lost from an untouched slice

5 CI never finished: every run "cancelled" at six hours

Now: install what the venv lacks, re-execute once at most; CI also checks out the original Slice.

8 × 6 h
every CI run from 24 August to 6 October, killed in the conformance job
1 min 49 s
the first run after the fix, all four jobs green

"Cancelled" read like someone pressing a button. It was a loop: the fixture step makes the test venv with fontTools only, and the runner, missing PyQt5, re-executed into it forever. On a workstation the venv already had PyQt5.

6 Moved to googlefonts

github.com/googlefonts/slice-web and googlefonts.github.io/slice-web. GitHub redirects the repository but not Pages, so every felipesanches.github.io/slice-web link now answers 404. Every link in the app, the docs and the manual points at the new home.

New checks behind these: tools/live-check.py slices on the deployed site through a user's own link; tools/ci-replay.sh runs the conformance job from CI's starting point — 141 restarts in 10 s before, one after.

Measured, not drawn. Names and bits are read from fonts the two builds saved in headless Chromium (Recursive, and Google Sans Flex 4.005 for the user's case); the CI bars come from GitHub's run history (ci-runs.json).

Caught by tests now. The browser test reads every name and bit back out of the saved font, and reopens the page's own link; both checks fail on the old code. CI checks out the original Slice, so the corpus compares against the real program.

Reproduce. docs/reports/2026-10-names-and-ci/; fixes 7fe0c72, d48bba1, 4e2c99c, 4445257, a0f1b31. Set in Google Sans Flex, sliced by the fixed Slice.
